

Risk Less. Do More.

Three reasons to vaccinate against flu, COVID-19, and RSV

1

You may be high risk (even if you don't know it). You're at higher risk for severe illness from influenza (flu), COVID-19, and respiratory syncytial virus (RSV) if you:

- Are 65 years and older;
- Have certain medical conditions like heart, lung, or kidney disease, diabetes, obesity, or asthma; or
- Have a weakened immune system.

If you are pregnant, your baby could be at risk for RSV.

2

Vaccines work best to keep you from getting severely ill if you get a respiratory infection from flu, COVID-19, or RSV. Flu and COVID-19 vaccines can prevent some infections, but like RSV vaccines, their primary job is to keep symptoms mild and keep people who get infected from needing medical or hospital care.

3

You can protect the people you love by encouraging them to join you in getting vaccinated to reduce the risk of serious flu, COVID-19, and RSV illness.

Vaccines prevent millions of cases of respiratory infections every year. They are a safe, trustworthy way to protect yourself. **Talk to your doctor to see which vaccines are right for you.**

**RISK LESS.
DO MORE.**
